

ACT-OA
CLINICAL STUDY

IS KNEE PAIN SLOWING YOU DOWN?

Clinical Studies for Patients with **Knee Osteoarthritis**

In the ACT-OA clinical study, Cytori Therapeutics is evaluating the treatment of knee osteoarthritis with **Adipose (fat) Derived Regenerative Cells** prepared by the investigational Celution[®] System.

If you (or someone you know):

- 1. Are between the ages of 40 and 70, and**
- 2. Have knee osteoarthritis, and**
- 3. Have chronic pain (at least 6 months), and**
- 4. Are able to undergo a liposuction procedure that removes ~1.5 cups of fat tissue from your body**

then you (or they) may be eligible to participate in the ACT-OA clinical study.

If eligible, each study participant will volunteer to complete several medical tests, answer questions, and have an investigational procedure performed by the study doctor. The participant will then return to the clinic 7 times over the course of 1 year to assess the effects of the investigational treatment on their osteoarthritis.
